Wireless Communication Systems @CS.NCTU

Lecture 2: Modulation and Demodulation Reference: Chap. 5 in Goldsmith's book Instructor: Kate Ching-Ju Lin (林靖茹)

From Wikipedia:

The process of varying one or more properties of a periodic <u>waveform</u> with a modulating signal that typically contains information to be transmitted.

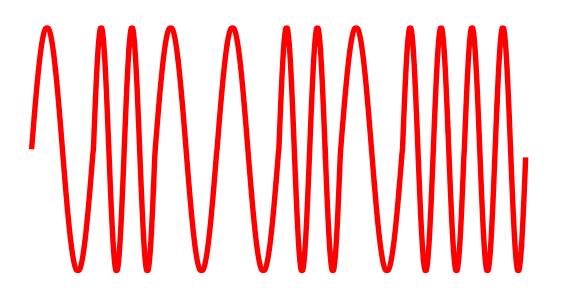

= bit-stream?

(a) 10110011 (b) 00101010 (c) 10010101

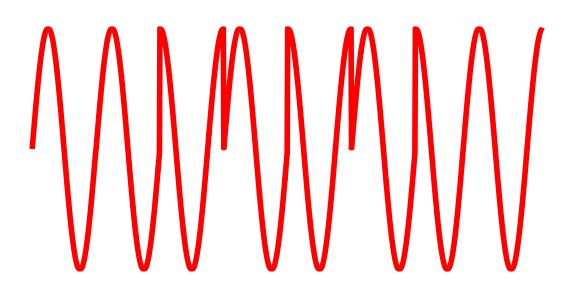

= bit-stream?

(a) 01001011 (b) 00101011 (c) 11110100

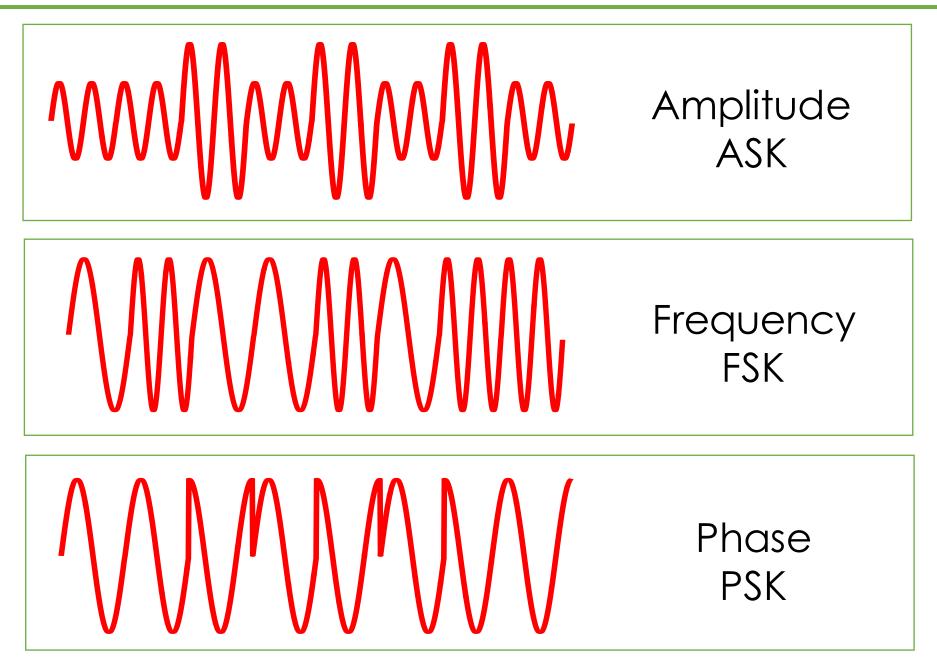

= bit-stream?

(a) 11010100 (b) 00101011

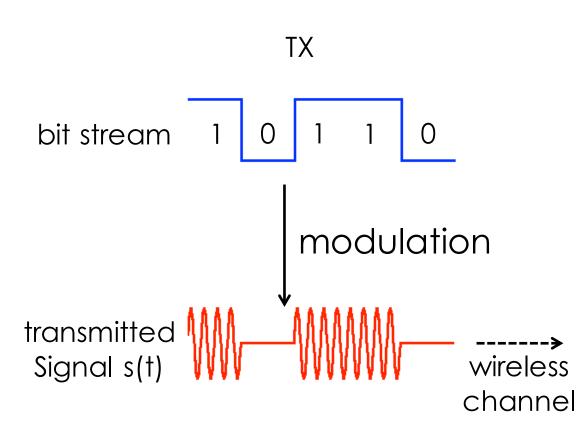

(c) 01010011 (d) 11010100 or 00101011

Types of Modulation

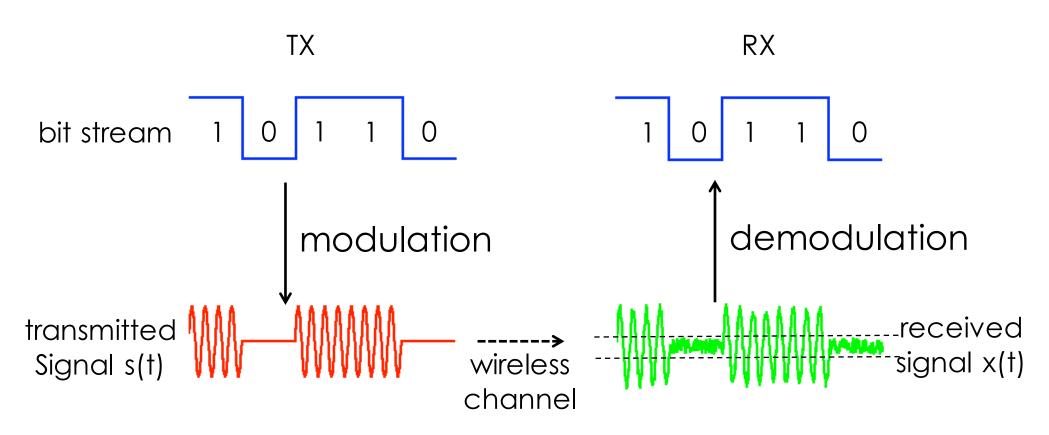

Modulation

• Map bits to signals

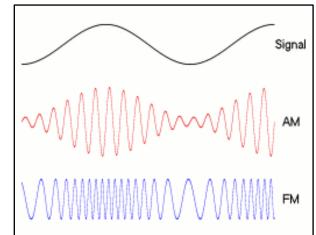

Demodulation

• Map signals to bits

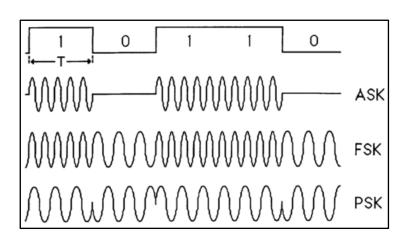

Analog and Digital Modulation

- Analog modulation
 - Modulation is applied continuously
 - Amplitude modulation (AM)
 - Frequency modulation (FM)
- Digital modulation

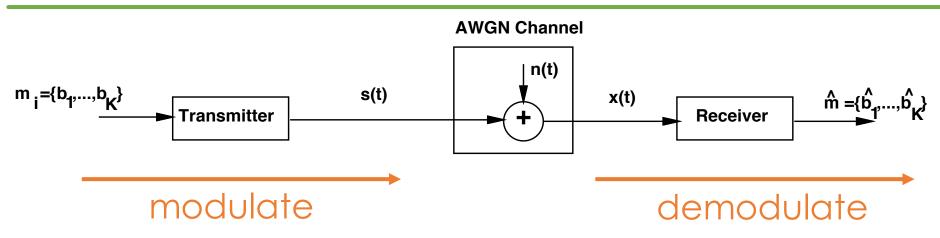

- An analog carrier signal is modulated by a discrete signal
- Amplitude-Shift Keying (ASK)
- Frequency-Shift Keying (FSK)
- Phase-Shift Keying (PSK)
- Quadrature Amplitude Modulation (QAM)

Advantages of Digital Modulation

- Higher data rate (given a fixed bandwidth)
- More robust to channel impairment
 - Advanced coding/decoding can be applied to make signals less susceptible to noise and fading
 - Spread spectrum techniques can be applied to deal with multipath and resist interference
- Suitable to multiple access
 - Become possible to detect multiple users simultaneously
- Better security and privacy
 - Easier to encrypt

Modulation and Demodulation

- Modulation
 - Encode a bit stream of finite length to one of several possible signals
- Delivery over the air
 - Signals experience fading and are combined with AWGN (additive white Gaussian noise)
- Demodulation
 - Decode the received signal by mapping it to the closest one in the set of possible transmitted signals

Band-pass Signal Representation

• General form

$$s(t) = a(t)cos(2\pi f_c t + \phi(t))$$

amplitude frequency phase

- Amplitude is always non-negative
 Or we can switch the phase by 180 degrees
- Called the canonical representation of a band-pass signal

$$a(t) = \frac{s(t)}{2\pi f_c t + \phi(t)}$$

In-phase and Quadrature Components

$$s(t) = a(t)\cos(2\pi f_c t + \phi(t)) = a(t)[\cos(2\pi f_c t)\cos(\phi(t)) - \sin(2\pi f_c t)\sin(\phi(t))] = s_I(t)\cos(2\pi f_c t) - s_Q(t)\sin(2\pi f_c t)$$

- $s_I(t) = a(t)\cos(\phi(t))$: In-phase component of s(t)
- $s_Q(t) = a(t) \sin(\phi(t))$: Quadrature component of s(t)

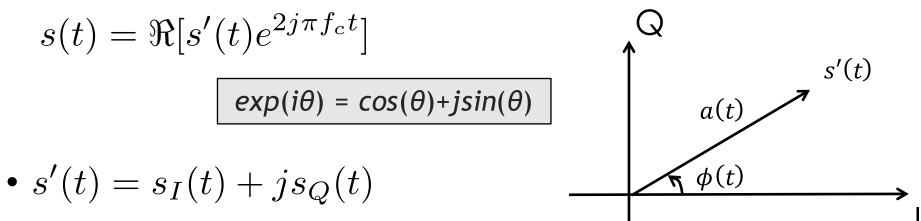

Amplitude:
$$a(t) = \sqrt{s_I^2(t) + s_Q^2(t)}$$

Phase: $\phi(t) = \tan^{-1}(\frac{s_Q(t)}{s_I(t)})$

Band-Pass Signal Representation

$$s(t) = s_I(t)\cos(2\pi f(t)t) - s_Q(t)\sin(2\pi f(t)t)$$

• We can also represent s(t) as

- s'(t) is called the complex envelope of the band-pass signal
- This is to remove the annoying $e^{2j\pi f_c t}$ in the analysis

Types of Modulation

 $s(t) = Acos(2\pi f_c t + \phi)$

- Amplitude
 - M-ASK: Amplitude Shift Keying
- Frequency
 - M-FSK: Frequency Shift Keying
- Phase
 - M-PSK: Phase Shift Keying
- Amplitude + Phase
 - M-QAM: Quadrature Amplitude Modulation

Amplitude Shift Keying (ASK)

- A bit stream is encoded in the amplitude of the transmitted signal
- Simplest form: On-Off Keying (OOK)

- '1'→A=1, '0'→A=0

M-ASK

M-ary amplitude-shift keying (M-ASK)

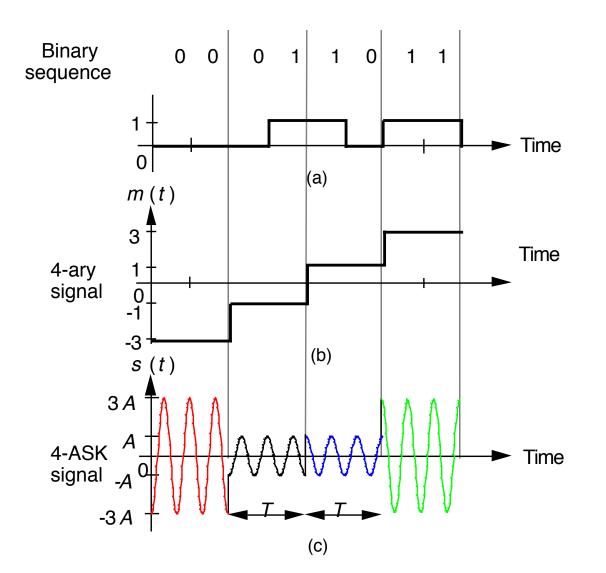

$$s(t) = \begin{cases} A_i \cos(2\pi f_c t) & \text{, if } 0 \le t \le T \\ 0 & \text{, otherwise,} \end{cases}$$

where $i = 1, 2, \cdots, M$

 A_i is the amplitude corresponding to bit pattern i

Example: 4-ASK

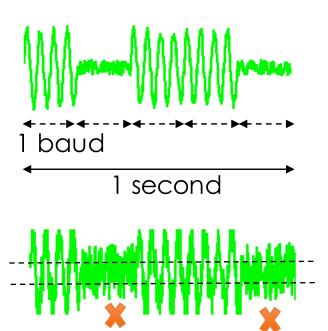

• Map '00', '01', '10', '11' to four different amplitudes

Pros and Cons of ASK

- Pros
 - Easy to implement
 - Energy efficient
 - Low bandwidth requirement
- Cons
 - Low data rate
 - bit-rate = baud rate
 - High error probability
 - Hard to pick a right threshold

Bandwidth is the difference between the upper and lower frequencies in a continuous set of frequencies.

Types of Modulation

$$s(t) = A\cos(2\pi f_c t + \phi)$$

^\M\\/\M\\

 $(\mathbf{A}, \mathbf{A}, \mathbf{A$

- Amplitude

 M-ASK: Amplitude Shift Keying

 Frequency

 M-ESK: Frequency Shift Keying
 - M-FSK: Frequency Shift Keying
- Phase
 - M-PSK: Phase Shift Keying
- Amplitude + Phase
 - M-QAM: Quadrature Amplitude Modulation

Frequency Shift Keying (FSK)

- A bit stream is encoded in the frequency of the transmitted signal
- Simplest form: Binary FSK (BFSK)

- '1' \rightarrow f=f₁, '0' \rightarrow f=f₂

M-ary frequency-shift keying (M-FSK)

$$s(t) = \begin{cases} A\cos(2\pi f_{c,i}t) & \text{, if } 0 \le t \le T \\ 0 & \text{, otherwise,} \end{cases}$$

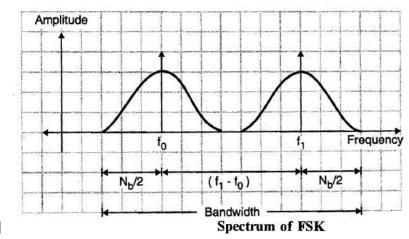

where $i = 1, 2, \cdots, M$

 $f_{c,i}$ is the center frequency corresponding to bit pattern i

- Example: Quaternary Frequency Shift Keying (QFSK)
 - Map '00', '01', '10', '11' to four different frequencies

Pros and Cons of FSK

- Pros
 - Easy to implement
 - Better noise immunity than ASK
- Cons
 - Low data rate
 - Bit-rate = baud rate
 - Require higher bandwidth
 - BW(min) = $N_b + N_b$

Types of Modulation

 $s(t) = Acos(2\pi f_c t + \phi)$

- Amplitude
 - M-ASK: Amplitude Shift Keying
- Frequency
 - M-FSK: Frequency Shift Keying
- Phase

- M-PSK: Phase Shift Keying

<eying

 $^{\Lambda}M^{\Lambda}M^{\Lambda}M^{\Lambda}$

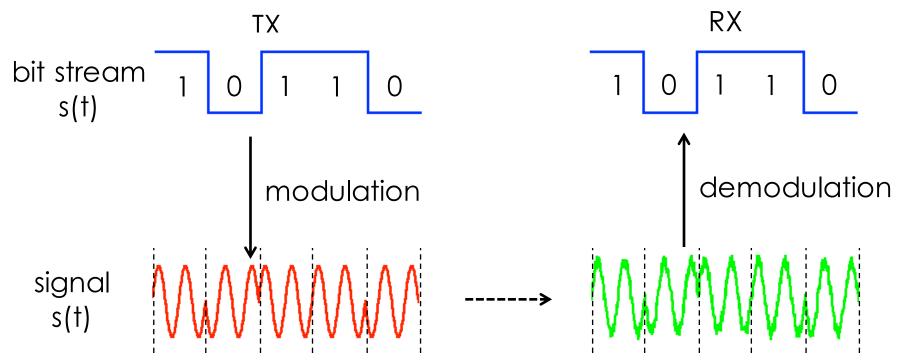

Amplitude + Phase

- M-QAM: Quadrature Amplitude Modulation

Phase Shift Keying (PSK)

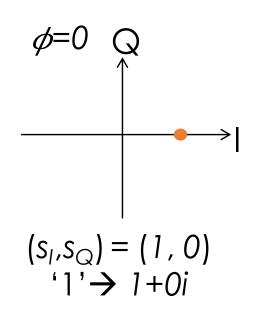

- A bit stream is encoded in the phase of the transmitted signal
- Simplest form: Binary PSK (BPSK)

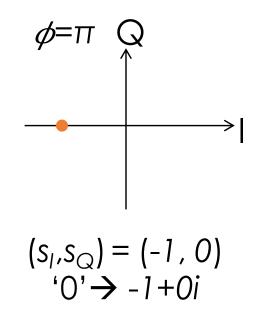

- '1' $\rightarrow \phi = 0$, '0' $\rightarrow \phi = \pi$

Constellation Points for BPSK

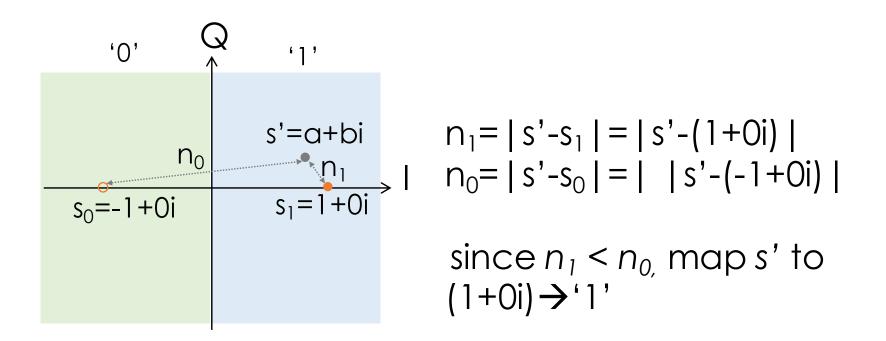

- '1'→φ=0
- $\cos(2\pi f_c t+0)$ = $\cos(0)\cos(2\pi f_c t)$ - $\sin(0)\sin(2\pi f_c t)$ = $s_1\cos(2\pi f_c t) - s_0\sin(2\pi f_c t)$
- '0'→φ=π
- $cos(2\pi f_c t + \pi)$ = $cos(\pi)cos(2\pi f_c t)$ $sin(\pi)sin(2\pi f_c t)$
 - $= s_1 cos(2\pi f_c t) s_Q sin(2\pi f_c t)$

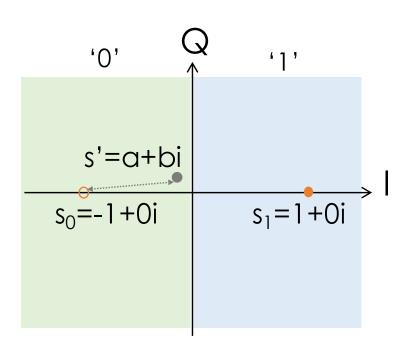

Demodulate BPSK

- Map to the closest constellation point
- Quantitative measure of the distance between the received signal s' and any possible signal s
 Find |s'-s| in the I-Q plane

Demodulate BPSK

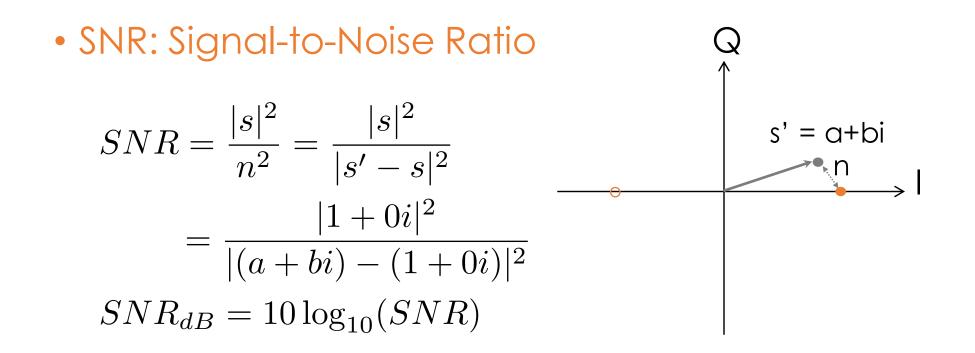

- Decoding error
 - When the received signal is mapped to an incorrect symbol (constellation point) due to a large error
- Symbol error rate
 - P(mapping to a symbol s_i , $j \neq i \mid s_i$ is sent)

Given the transmitted symbol s₁

 \rightarrow incorrectly map s' to $s_0=(-1+0)\rightarrow$ '0', when the error is too large

SNR of BPSK

- Example:
 - Say Tx sends (1+0i) and Rx receives (1.1 0.01i)
 - SNR?

SER/BER of BPSK

• BER (Bit Error Rate) = SER (Symbol Error Rate)

$$SER = BER = P_b$$

Minimum distance of any
two cancellation points
$$= Q\left(\frac{d_{\min}}{\sqrt{2N_0}}\right) = Q\left(\sqrt{\frac{2E_b}{N_0}}\right) = Q(\sqrt{2SNR})$$

From Wikipedia:

Q(x) is the probability that a normal (Gaussian) random variable will obtain a value larger than x standard deviations above the mean.

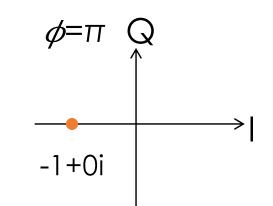

$$Q(x) = rac{1}{\sqrt{2\pi}} \int_x^\infty \exp\!\left(-rac{u^2}{2}
ight) du.$$

Constellation point for BPSK

- Say we send the signal with phase delay π

 $\begin{aligned} \cos(2j\pi f_c t + \pi) \\ = \cos(2j\pi f_c t) \cos(\pi) - \sin(2j\pi f_c t) \sin(\pi) \\ = -1 * \cos(2j\pi f_c t) - 0 * \sin(2j\pi f_c t) \\ = (-1 + 0i)e^{2j\pi f_c t} \longrightarrow \text{Band-pass representation} \end{aligned}$

Illustrate this by the <u>constellation</u> <u>point</u> (-1 + 0i) in an I-Q plane

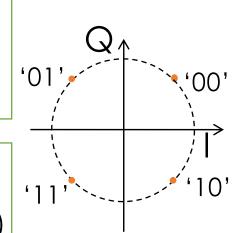

Quadrature PSK (QPSK)

 Use four phase rotations 1/4π, 3/4π, 5/4π, 7/4π to represent '00', '01', '11', 10'

$$A\cos(2j\pi f_c t + \pi/4) = A\cos(2j\pi f_c t)\cos(\pi/4) - A\sin(2j\pi f_c t)\sin(\pi/4) = 1 * \cos(2j\pi f_c t) - 1 * \sin(2j\pi f_c t) = (1+1i)e^{2j\pi f_c t}$$

 $A\cos(2j\pi f_c t + 3\pi/4)$ = $A\cos(2j\pi f_c t)\cos(3\pi/4) - A\sin(2j\pi f_c t)\sin(3\pi/4)$ = $-1 * \cos(2j\pi f_c t) - 1 * \sin(2j\pi f_c t)$ = $(-1 + 1i)e^{2j\pi f_c t}$

Quadrature PSK (QPSK)

- Use 2 degrees of freedom in I-Q plane
- Represent two bits as a constellation point
 - Rotate the constellations by $\pi/2$
 - Demodulation by mapping the received signal to the closest constellation point
 - Double the bit-rate
- No free lunch:

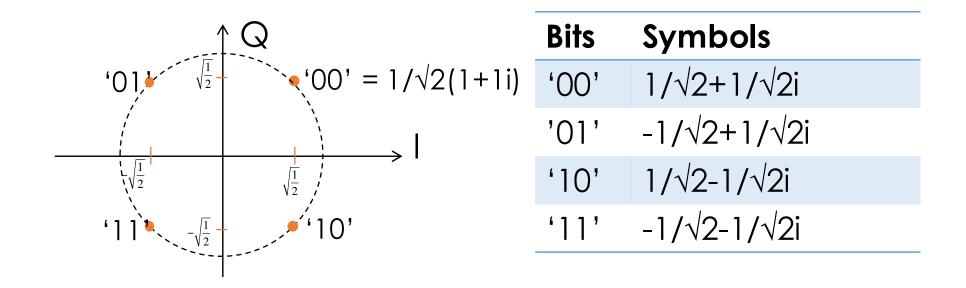

- Higher error probability (Why?)

Quadrature PSK (QPSK)

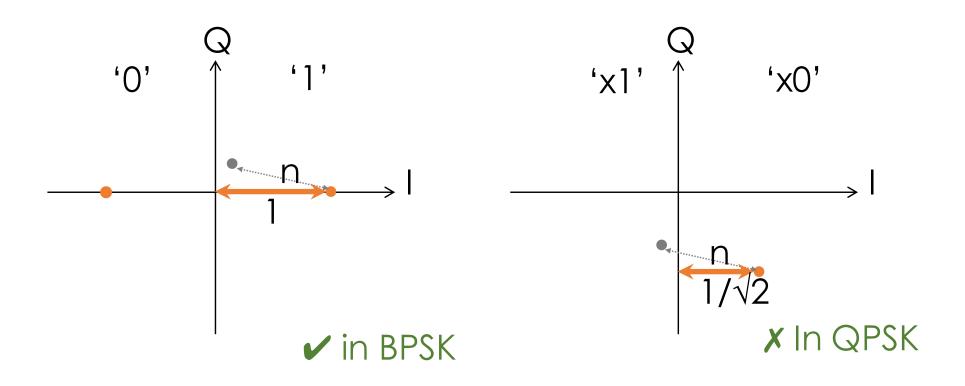

Maximum power is bounded

- Amplitude of each constellation point should still be 1

Higher Error Probability in QPSK

- For a particular error *n*, the symbol could be decoded correctly in BPSK, but not in QPSK
 - Why? Each sample only gets half power

Trade-off between Rate and SER

- Trade-off between the data rate and the symbol error rate
 - Denser constellation points
 - \rightarrow More bits encoded in each symbol
 - \rightarrow Higher data rate
 - Denser constellation points
 - \rightarrow Smaller distance between any two points
 - → Higher decoding error probability

SEN and BER of QPSK

• SNR_s: SNR per symbol; SNR_b: SNR per bit

$$SNR_b \approx \frac{SNR_s}{\log_2 M}, P_b \approx \frac{P_s}{\log_2 M}$$
 QPSK: M=4

• SER: The probability that each branch has a bit error

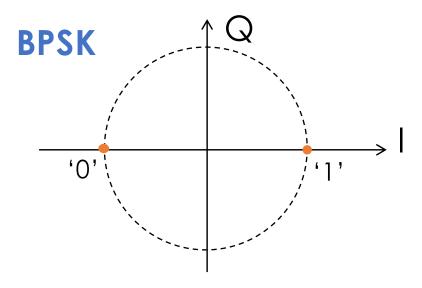

$$SER = P_s = 1 - \left[1 - Q(\sqrt{2SNR_b})\right]^2 = 1 - \left[1 - Q(\sqrt{\frac{2E_b}{N_0}})\right]^2$$
$$= 1 - \left[1 - Q(\sqrt{SNR_s})\right]^2 = 1 - \left[1 - Q(\sqrt{\frac{E_s}{N_0}})\right]^2$$
$$\mathsf{RFR}$$

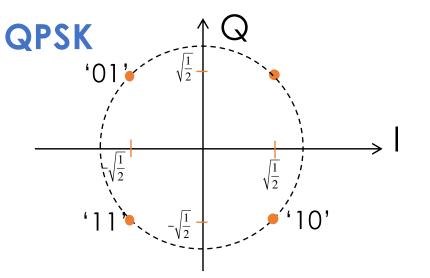

BER

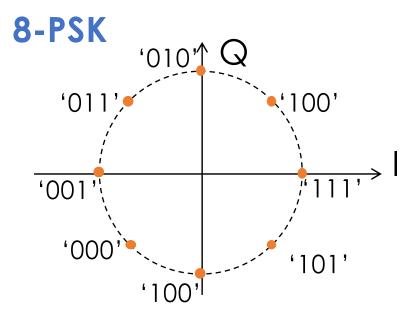

$$BER = P_b \approx \frac{P_s}{2}$$

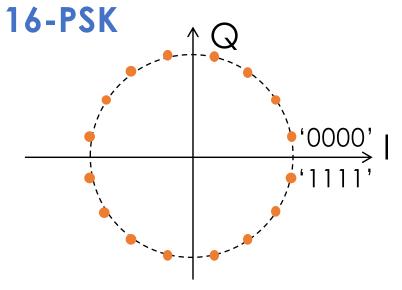

E_s is the bounded maximum power

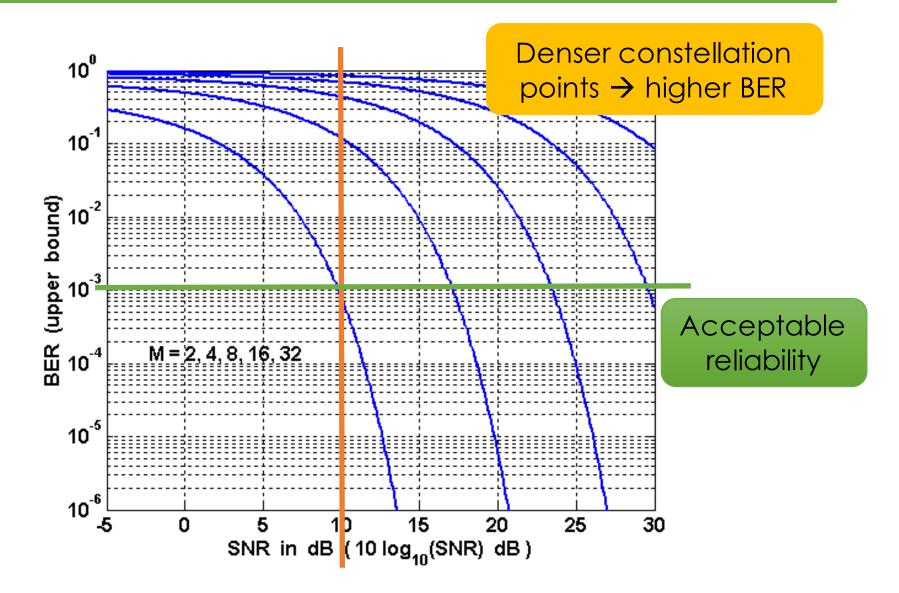

M-PSK BER versus SNR

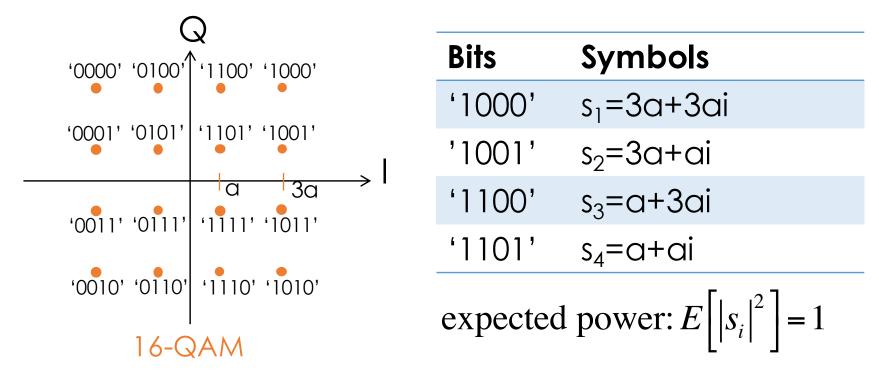

Types of Modulation

 $s(t) = Acos(2\pi f_c t + \phi)$

- Amplitude
 - M-ASK: Amplitude Shift Keying
- Frequency
 - M-FSK: Frequency Shift Keying
- Phase
 - M-PSK: Phase Shift Keying
- Amplitude + Phase
 - M-QAM: Quadrature Amplitude Modulation

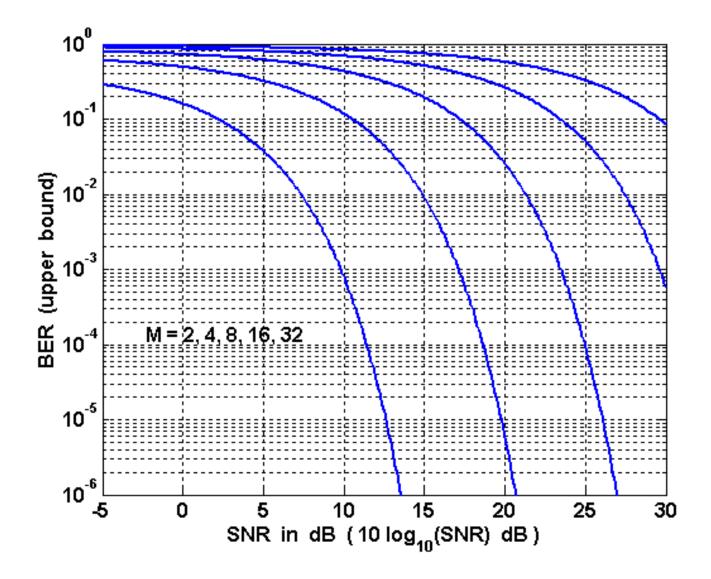

Quadrature Amplitude Modulation

- Change both amplitude and phase
- $s(t) = A\cos(2\pi f_c t + \phi)$

• 64-QAM: 64 constellation points, each with 8 bits

M-QAM BER versus SNR

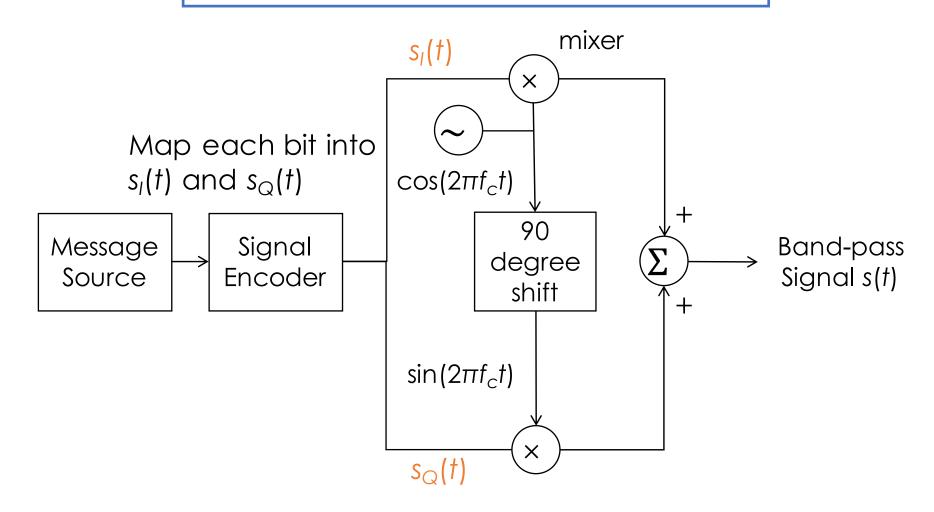

Modulation in 802.11

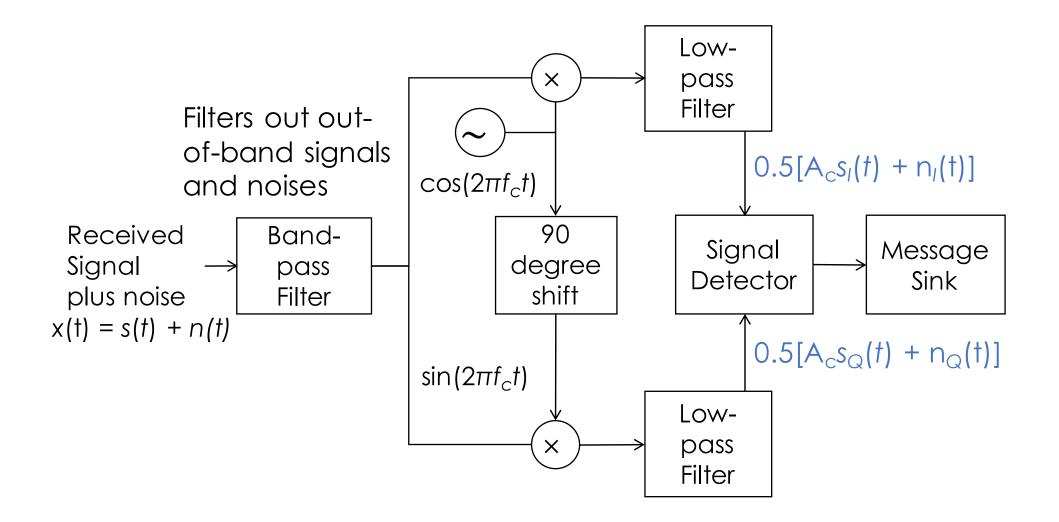

- 802.11a
 - 6 mb/s: BPSK + ½ code rate
 - 9 mb/s: BPSK + ³/₄ code rate
 - 12 mb/s: QPSK + ½ code rate
 - 18 mb/s: QPSK + ³/₄ code rate
 - 24 mb/s: 16-QAM + ½ code rate
 - 36 mb/s: 16-QAM + ³/₄ code rate
 - 48 mb/s: 64-QAM + ²/₃ code rate
 - 54 mb/s: 64-QAM + ³/₄ code rate
- FEC (forward error correction)
 - k/n: k-bits useful information among n-bits of data
 - Decodable if any k bits among n transmitted bits are correct

Band-Pass Signal Transmitter

$$s(t) = s_I(t)\cos(2\pi f_c t) - s_Q(t)\sin(2\pi f_c t)$$

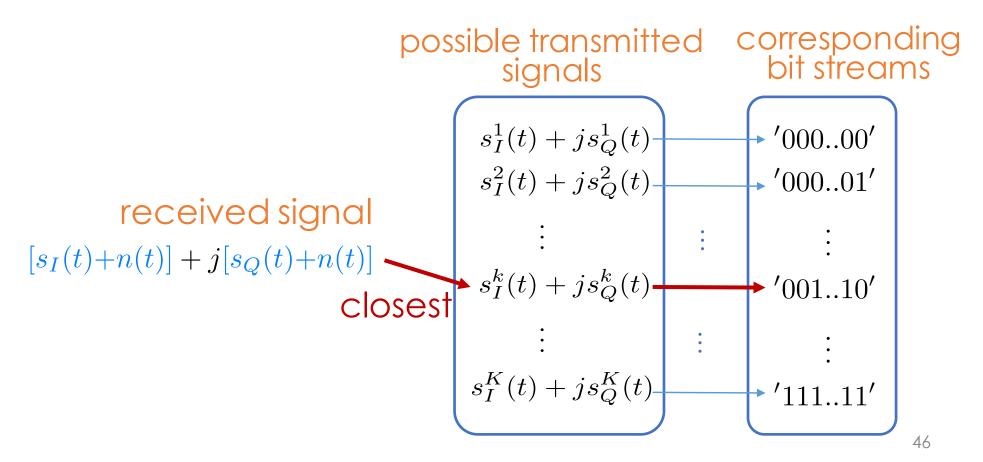

Band-Pass Signal Receiver

Detection

- Map the received signal to one of the possible transmitted signal with the minimum distance
- Find the corresponding bit streams

Announcement

- Install Matlab
- Teaming
 - Elevator pitch: 2 per group (Each group talks about 3-5 minutes. Each member needs to talk)
 - Lab and project: 3-4 members per group
 - Send your team members to the TA (張威竣)
- Sign up for the talk topic
 - Pick the paper (topic) according to your preference or schedule
 - Sign up from 18:00@Thu (will announce the url in the announcement tab of the course website)
 - Pick your top five choices (from Lectures 4-18)
 - FIFS

- What are the four types of modulation introduced in the class?
- Say Tx sends (-1 + 0i) and Rx receives -(0.95+0.01i). Calculate the SNR.
