- Push AX

The evolution of programming paradigms

VB 6.0 and before: Object-Based

VB dot Net : Object Oriented

Imperative Paradigm

- Procedural paradigm
- Develops a sequence of commands that when followed, manipulate data to produce the desired result
- Approaches a problem by trying to find an algorithm for solving it

Object-Oriented Paradigm

- Grouping/classifying entities in the program
 - Entities are the objects
 - Groups are the classes
 - Objects of a class share certain properties
 - Properties are the variables or methods
- Encapsulation of data and procedures
 - Lists come with sorting functions
- Natural modular structure and program reuse
 - Inheriting from mother class definitions
- Many large-scale software systems are developed in the object oriented fashion

Declarative Paradigm

- Emphasizes
 - “What is the problem?”
 - Rather than “What algorithm is required to solve the problem?”
- Implemented a general problem-solving algorithm
- Develops a statement of the problem compatible with the algorithm and then applies the algorithm to solve it

Functional Paradigm

- Views the process of program development as connecting predefined “black boxes,” each of which accepts inputs and produces outputs
- Mathematicians refer to such “boxes” as functions
- Constructs functions as nested complexes of simpler functions

Chapter 6: Programming Languages

6.1 Historical Perspective

6.2 Traditional Programming Concepts

6.3 Procedural Units

6.4 Language Implementation

6.5 Object Oriented Programming

6.6 Programming Concurrent Activities

6.7 Declarative Programming

The composition of a typical **imperative** program or program unit

The same **variable** declarations in different languages

a. Variable declarations in Pascal

```
var
    Length, Width:      real;
    Price, Tax, Total: integer;
    Symbol:              char;
```

b. Variable declarations in C, C++, C#, and Java

```
float Length, Width;
int Price, Tax, Total;
char Symbol;
```

c. Variable declarations in FORTRAN

```
REAL Length, Width
INTEGER Price, Tax, Total
CHARACTER Symbol
```

Figure 6.5: A two-dimensional array with two rows and nine columns

Scores

Scores (2, 4) in
FORTRAN where
indices start at one.

Scores [1] [3] in C
and its derivatives
where indices start
at zero.

INTEGER Scores(2,9)

Column major

int Scores[2][9];

Row major

Figure 6.6a:

Declaration of **heterogeneous** arrays in Pascal and C

異質性的

a. The array declaration in Pascal

```
var
  Employee: record
    Name: packed array[1. . 8] of char;
    Age: integer;
    SkillRating: real
  end
```

b. The array declaration in C

```
struct
{ char Name [8];
  int Age;
  float SkillRating;
} Employee;
```

Figure 6.6b: Declaration of heterogeneous arrays in Pascal and C (continued)

c. The conceptual organization of the array

User defined data structure

Figure 6.7a: Control structures and their representations in C, C++, C#, and Java

switch .. case

```
switch (N)
{ case C1: S1; break;
  case C2: S2; break;
  case C3: S3; break;
};
```

Falling through !

Figure 6.7b:
Control structures and their representations in C, C++, C#, and Java
(continued)
if-then-else
while loop

The **for loop** structure and its representation in Pascal/Delphi, C++, C#, and Java

Pascal

```
for Count := 1 to 3 do  
begin  
    body  
end;
```

C++, C#, and Java

```
for (int Count = 1; Count < 4; Count++)  
    body;
```

for Loop vs. while Loop

```
for(i=1 ; i<= 9 ; i++)  
{  
    /* Loop body */  
}
```

這三個寫法意義
完全一樣

```
i=1;  
for( ; i<= 9 ; )  
{  
    /* Loop body */  
    i++;  
}
```

```
i=1;  
while( i<= 9 )  
{  
    /* Loop body */  
    i++;  
}
```

for Loop vs. while Loop

for(① ; ② ; ③) ④;

```
①;  
while(② )  
{  
    ④ ;  
    ③;  
}
```

Figure 6.8 The flow of **control** involving a **procedure or function**

The procedure Project Population written in the programming language C

Starting the head with the term "void" is the way that a C programmer specifies that the program unit is a procedure rather than a function. We will learn about functions shortly.

The formal parameter list. Note that C, as with many programming languages, requires that the data type of each parameter be specified.

```
void ProjectPopulation (float GrowthRate)
```

```
{ int Year;
```

This declares a local variable named Year.

```
Population[0] = 100.0;
for (Year = 0; Year < 10; Year++)
Population[Year+1] = Population[Year] + (Population[Year] * GrowthRate);
}
```

These statements describe how the populations are to be computed and stored in the global array named Population.

Executing the procedure Demo and passing parameters by value

- a. When the procedure is called, a copy of the data is given to the procedure

Calling environment

Procedure's environment

- b. and the procedure manipulates its copy.

Calling environment

Procedure's environment

- c. Thus, when the procedure has terminated, the calling environment has not been changed.

Calling environment

Executing the procedure Demo and **passing parameters by reference** (1/2)

- a. When the procedure is called, the formal parameter becomes a reference to the actual parameter.

Calling environment

Procedure's environment

C++

```
void swap(int& x, int& y);
```

Pascal/Delphi

```
procedure swap(var x:integer; var y:integer);
```

Executing the procedure Demo and passing parameters **by reference** (2/2)

- b.** Thus, changes directed by the procedure are made to the actual parameter

Calling environment

Procedure's environment

- c.** and are, therefore, preserved after the procedure has terminated.

Calling environment

The function CylinderVolume written in the programming language C

The function header begins with the type of the data that will be returned.

```
float CylinderVolume (float Radius, float Height)
```

```
{ float Volume;
```

Declare a local variable named Volume.

```
Volume = 3.14 * Radius * Radius * Height;
```

```
return Volume;
```

Compute the volume of the cylinder.

```
}
```

Terminate the function and return the value of the variable Volume.

An example of formatted output in C/C++ Language

Java JDK 1.5 (5.0) and above support printf()

The complete program preparation process

These tasks are What the **compiler** doing.

Compiler vs. Interpreter

- Compiler 編譯器 (翻譯完就不管了)
 - Source code → Object code
- Interpreter 解譯器 (負責做出答案或結果)
 - Source code → Object code → Result

Data

A black arrow originates from the word 'Data' and points diagonally upwards and to the right, ending at the arrow between 'Object code' and 'Result' in the interpreter's workflow.

A syntax diagram of the if-then-else pseudocode statement

if (boolean-expression) then statement-1
else statement-2;

Similar to the if-statement in Pascal Language

C/C++/Java 的 if statement 沒有 “then”
且 else 之前有分號 “;”

Syntax diagrams describing the structure of a simple algebraic expression

Expression

Term

Factor

Wirth, Niklaus
(Pascal 的發明者)
發明的

Syntax diagram is invented by Niklaus Wirth

for the string

$x + y * z$

based on the

syntax

diagrams in

previous

Figure

parse tree $\neq$ Ex

Two distinct parse trees for the statement **if B1 then if B2 then S1 else S2** (1/2)

Two distinct parse trees for the statement if B1 then if B2 then S1 else S2 (2/2)

Chapter 6: Programming Languages

6.1 Historical Perspective

6.2 Traditional Programming Concepts

6.3 Procedural Units

6.4 Language Implementation

6.5 Object Oriented Programming

6.6 Programming Concurrent Activities

6.7 Declarative Programming

Objects and Classes

- **Object**
 - Active program unit containing both data and procedures (methods or functions)
- **Class**
 - A template for all objects of the same type

An **Object** is often called an **instance** of the class.

Object 就是以前的變數; class 是一種 type

Components of an object

- **Instance variable (attribute)**
 - Variable within an object
- **Method**
 - **Function** or procedure within an object
 - Can manipulate the object's instance variables
- **Constructor**
 - Special method to initialize a new object instance

Class is an ADT

ADT : Abstract Data Type

Class Example

```
class LaserClass
```

```
{  int RemainingPower = 100;
```

```
    void turnRight ( )  
    { ... }
```

```
    void turnLeft ( )  
    { ... }
```

```
    void fire ( )  
    { ... }
```

```
}
```

Description of the data
that will reside inside of
each object of this "type."

Methods describing how an
object of this "type" should
respond to various messages

Constructor Example

```
class LaserClass  
{ int RemainingPower;
```

Constructor assigns a value to Remaining Power when an object is created.

```
{ LaserClass (InitialPower)  
  { RemainingPower = InitialPower;  
  }
```

```
void turnRight ( )  
{ ... }
```

```
void turnLeft ( )  
{ ... }
```

```
void fire ( )  
{ ... }
```

```
}
```

Encapsulation 封藏

- **Encapsulation**

- A way of restricting access to the internal components of an object
- **Private**
- **Public**
- **Protected**
- Package available (default access in Java)

Encapsulation Example

The structure of a class describing a laser weapon in a computer game

Components in the class are designated public or private depending on whether they should be accessible from other program units.

```
class LaserClass
{private int RemainingPower;
public LaserClass (InitialPower)
{RemainingPower = InitialPower;
}
public void turnRight ( )
{ ... }
public void turnLeft ( )
{ ... }
public void fire ( )
{ ... }
}
```

LaserClass definition using encapsulation as it would appear in a Java or C# program

Components in the class are designated public or private depending on whether they should be accessible from other program units.

```
class LaserClass
{private int RemainingPower;
public LaserClass (InitialPower)
{RemainingPower = InitialPower;
}
public void turnRight ( )
{ ... }
public void turnLeft ( )
{ ... }
public void fire ( )
{ ... }
}
```

Additional Concepts

- Inheritance 繼承 (extends 擴充)
 - Allows new classes to be defined in terms of previously defined classes
- Polymorphism 多型; 同名異式
 - Allows method calls to be interpreted by the object that receives the call dynamically

Function name Overloading : static binding

Polymorphism : dynamic binding

Chapter 6: Programming Languages

6.1 Historical Perspective

6.2 Traditional Programming Concepts

6.3 Procedural Units

6.4 Language Implementation

6.5 Object Oriented Programming

6.6 Programming Concurrent Activities

6.7 Declarative Programming

Program Concurrent Activities

- **Parallel** or **concurrent** processing
- **Simultaneous** execution of multiple processes
- True concurrent processing requires multiple CPUs (**true concurrent** means **Simultaneous**)
- Can be simulated using time-sharing with a single CPU
- Examples: Ada task and **Java thread**

Concurrent **!=** **Simultaneous**

Parallel Processing

Basic Idea

- Creating new process (or thread)
- Handling communication between processes
- Mutually exclusive access over **critical regions**
 - Data accessed by only one process at a time
- Monitor
 - A data item augmented with the ability to control access to itself
- (以後在 Java 課討論)

Declarative Programming

- **Resolution**
 - Combining two or more statements to produce a new, logically equivalent statement
- **Resolvent**
 - a new statement deduced by resolution
- Example: $(P \text{ OR } Q) \text{ AND } (R \text{ OR } \neg Q)$
resolves to $(P \text{ OR } R)$

Logical Deduction

- Either Kermit is on stage (Q) or Kermit is sick (P)
- Kermit is not on stage (not Q)
- Kermit is sick (P)
- Resolution Principle

$$\begin{array}{ccc}
 P \text{ OR } Q & \downarrow & \neg Q \rightarrow P \\
 \neg Q & \longrightarrow & P
 \end{array}$$

Resolving

$(P \text{ OR } Q)$ and $(R \text{ OR } \neg Q)$ to Produce $(P \text{ OR } R)$

Truth Table

P	Q	$\neg P$	$P \wedge Q$	$P \vee Q$	$P \rightarrow Q$	$P \leftrightarrow Q$
False	False	True	False	False	True	True
False	True	True	False	True	True	False
True	False	False	False	True	False	False
True	True	False	True	True	True	True

Clause Form

- **First-order predicate logic** vs. Higher-order predicate logic
- Clause form

$$(P_1 \text{ OR } Q_1) \text{ AND } (P_2 \text{ OR } Q_2) \text{ AND } \cdots \text{ AND } (P_N \text{ OR } Q_N)$$

Confirming the Inconsistency of a Set of Inconsistent Clauses

Interpretation

- P: Kermit is on stage
- Q: Kermit has got SARS for two weeks
- R: Kermit coughs

$$P \text{ OR } Q \equiv \neg Q \rightarrow P$$

$$R \text{ OR } \neg Q \equiv \neg R \rightarrow \neg Q$$

$$P \text{ OR } R \equiv \neg R \rightarrow P$$

Automatic Reasoning using reduction ad absurdum

- Want to confirm a collection of statements implies the statement P
- Same as contradicting the statement $\neg P$
- Apply resolution to the original statements and the statement $\neg P$ until an empty clause occurs
- With $\neg P$ inconsistent with the original statements, the original statements must imply P

Unification

- The process of assigning values to variables so that resolution can be performed

(Mary is at X) $\rightarrow$ (Mary's lamb is at X)

Mary is at home

$\neg$ (Mary is at X) OR (Mary's lamb is at X)

(Mary is at home)

$\neg$ (Mary is at home) OR (Mary's lamb is at home)

(Mary is at home)

(Mary's lamb is at home)

Prolog

- **PRO**gramming in **LOGic**
- A Prolog program consists of a collection of initial statements upon which the underlying algorithm bases its deductive reasoning

Prolog Syntax

- **Fact**
 - *predicateName(arguments).*
 - Example: `parent(bill, mary).`
- **Rule**
 - *conclusion :- premise.*
 - `:-` means “if”
 - Example: `wise(X) :- old(X).`
 - Example: `faster(X,Z) :- faster(X,Y), faster(Y,Z).`
- All statements must be fact or rules.

Sample Prolog program (1/2)

```
bsd2% cat hom.pl
:-dynamic loves/2.
loves(kmy,mary) .
loves(mary,kmy) .
loves(chang3,mary) .
samesex(X,Y) :- male(X) , male(Y) .
samesex(X,Y) :- female(X) , female(Y) .
male(chang3) .
female(mary) .
female(kmy) .
hom(X,Y) :- loves(X,Y), loves(Y,X), samesex(X,Y).
shuey(X) :- loves(X,Y) , hom(Y,Z) , not(Z=X) .
bsd2%
```

Sample Prolog program (2/2)

```
bsd2% pl
Welcome to SWI-Prolog ...
1 ?- [hom].
hom compiled, 0.00 sec, 1,672 bytes.
Yes
2 ?- listing.
...
3 ?- hom(kmy,mary).
Yes
4 ?- shuey(chang3).
Yes
5 ?- listing(loves).
loves(kmy, mary).
loves(mary, kmy).
loves(chang3, mary).
Yes
6 ?- assert(loves(lee4,kmy)).
```

A GCD program in Prolog

```
bsd2% cat -n gcd.pl
```

```
1 gcd(A,0,A).
2 gcd(A,B,D):- (A>B), (B>0),
3           R is A mod B, gcd(B,R,D).
4 gcd(A,B,D):- A<B, gcd(B,A,D).
5 run:- write('first number='),read(X),
6       write('second number='), read(Y),
7       gcd(X,Y,ANS), write('The gcd of '),
8       write(X), write(' and '), print(Y),
9       put(' '),print(is), put(' '), write(ANS).
```

```
bsd2 % pl
```

```
Welcome to SWI-Prolog ( ...
```

```
1 ?- [gcd].
```

Run the GCD prolog program

2 ?- **gcd(4,6,ANS).**

ANS = 2

Yes

3 ?- **run.**

first number=6.

second number=9.

The gcd of 6 and 9 is 3

Yes

4 ?- listing.

...

A Factorial(N) program in Prolog

```
bsd2% cat -n factn.pl
```

```
1  fact_aux(N, FactN, I, P) :-  
2    I =< N, !,  
3    NewP is P * I,  
4    NewI is I + 1,  
5    fact_aux(N, FactN, NewI, NewP).  
6  fact_aux(N, FactN, I, FactN) :-  
7    I > N.  
8  fact(N, FactN) :-  
9    fact_aux(N, FactN, 1, 1).  
10 run:- write('Give me a positive number: '),read(X),  
11      fact(X,ANS),  
12      write('The Factorial of '),  
13      write(X), write(' is '),  
14      write(ANS).
```

```
bsd2%
```

Run the Factorial(N) Prolog program

```
bsd2 % pl
```

```
Welcome to SWI-Prolog ( ...
```

```
1 ?- factn.
```

```
Yes
```

```
2 ?- run.
```

```
Give me a positive number: 5.
```

```
The Factorial of 5 is 120
```

```
Yes
```

```
3 ?- run.
```

```
Give me a positive number: 6.
```

```
The Factorial of 6 is 720
```

```
Yes
```

```
4 ?- listing(fact).
```

Thank You!

Programming Languages
