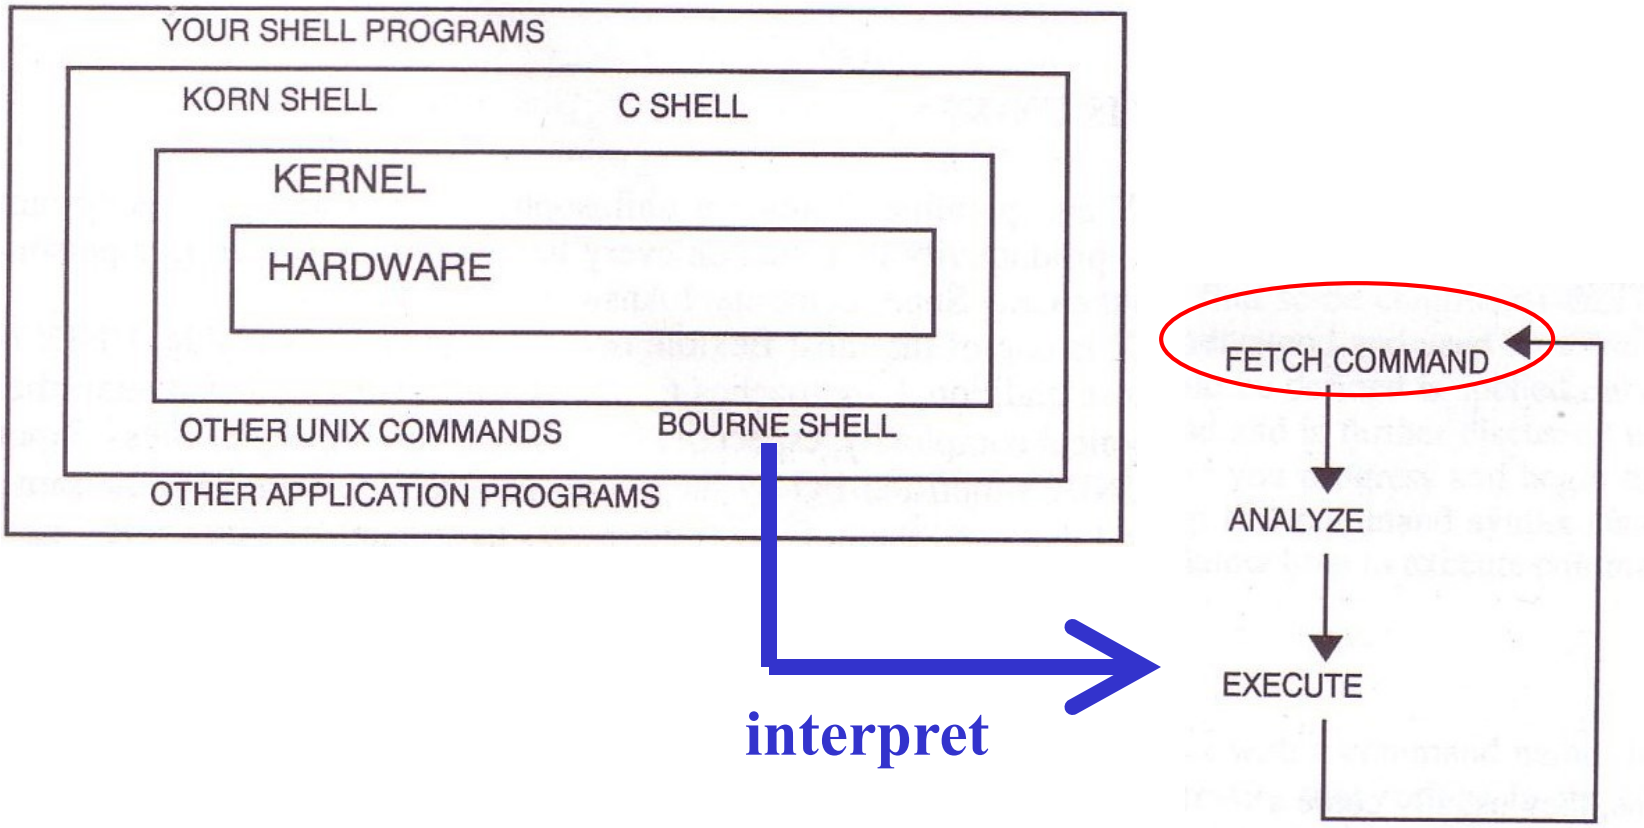
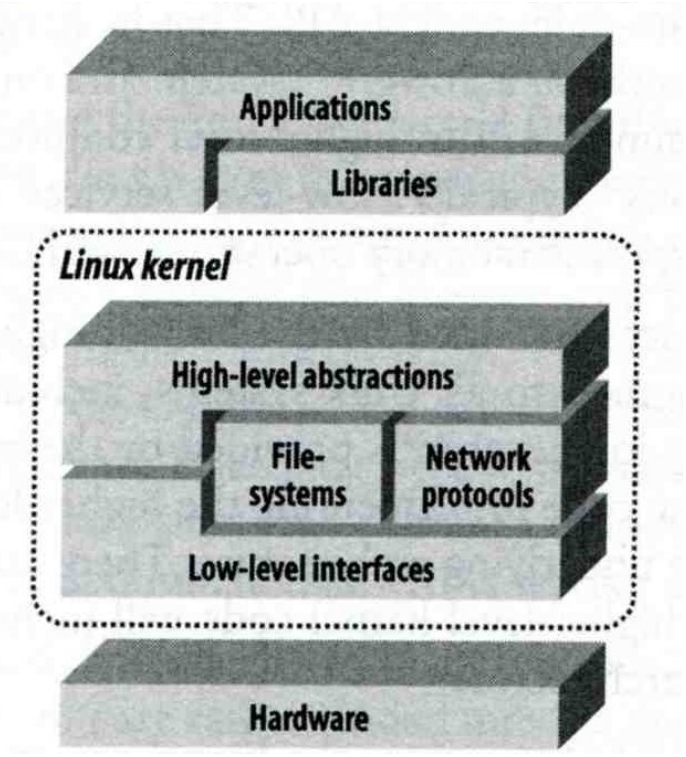
Drivers and the Kernel

Introduction – UNIX Kernel and Shell

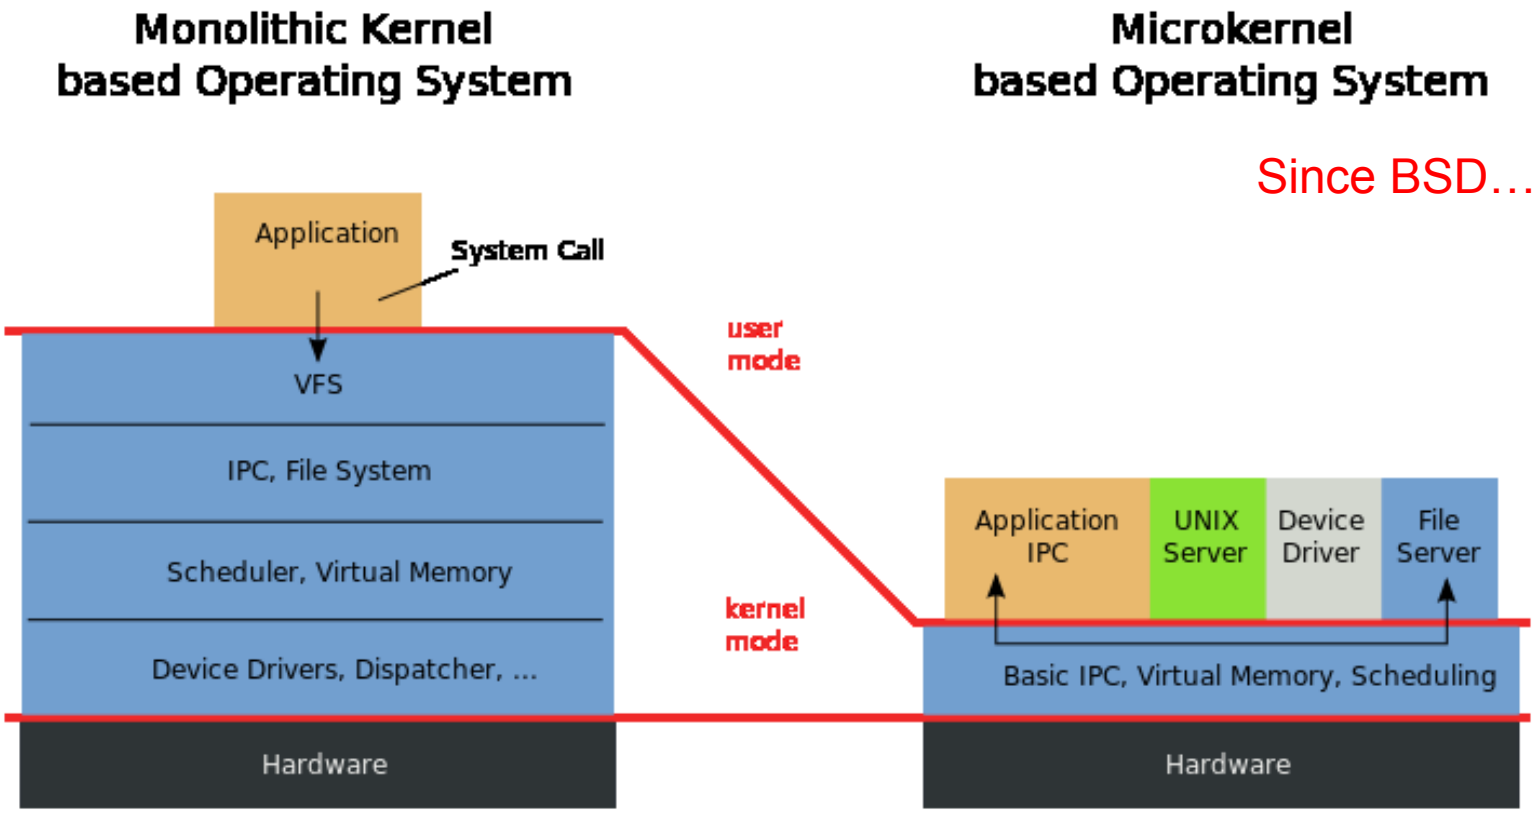


Roles of Kernel

- Components of a UNIX System
  - User-level programs
  - Kernel
  - Hardware
- Two roles of kernel (OS)
  - High-level abstractions
    - Process managements
      - Time sharing, memory protect
    - File system management
    - Memory management
    - I/O management
  - Low-level interface
    - drivers



Kernel Types



https://en.wikipedia.org/wiki/Microkernel

Kernel Types

Concept of being modulized…
only provides essential functionalities;
Put other sophisticated functions into user level
e.g. I/O management in the user level

- increase scalability and less difficult in maintenance
- How to communicate?
  → Message passing – less efficient

- Two extreme types
  - **Microkernel**
    - **Provide only necessarily, compact and small functionalities**
    - **Other functions is added via well-defined interface**
  - **Monolithic kernel (龐大的kernel – e.g., UNIX)**
    - **Whole functionalities in one kernel**

More integrated…

- Modern OS
  - Solaris
    - **Completely modular kernel**
    - **Load necessarily module when it is needed**
  - BSD/Linux-derived system
    - **Much of the kernel's functionality is contained in modules**

Monolithic kernel developing towards micro kernel (being more modulized), but without IPC (message passing) problem

Kernel related directory

- Build directory and location

System	Build Directory	Kernel file
FreeBSD	/usr/src/sys	/kernel (< 4.x) /boot/kernel/kernel (> 5.x)
Red Hat	/usr/src/linux	/vmlinuz or /boot/vmlinuz
Solaris	-	/kernel/unix
SunOS	/usr/kvm/sys	/vmunix

Why configure the kernel?

Generic: with various devices…, functions supported

- The native kernel is often big and common
- Tailoring kernel to match site situation
  - Purge unnecessary kernel devices and options
  - Add functionalities that you want
- OS patch
  - Remedy security hole of kernel implementation
- Fine-tune system performance
  - Such as adjusting important system parameters
- Adding device drivers
- Fast boot time
- Lower memory usage

kernel image → memory usage

Building a FreeBSD Kernel

- Kernel source
  - /usr/src/sys
- Kernel configuration file
  - /usr/src/sys/<ARCH>/conf
    - GENERIC, LINT (< 4.X)
    - GENERIC, "make LINT" under this dir (> 5.x)
- Steps to build a new kernel
  - Edit /usr/src/sys/<ARCH>/conf/<KERNCONF>
    - For example, save a configuration file named as SABSD
  - % cd /usr/src ;
  - % make buildkernel KERNCONF=SABSD
  - % make installkernel KERNCONF=SABSD

<ARCH> represents one of i386, amd64, ia64, powerpc, sparc64

LINT file: lists all options

→ To generate LINT file

https://www.freebsd.org/doc/en/books/handbook/kernelconfig-building.html

To Build a FreeBSD Kernel…

- What to Choose?
- What to Load?
- Option Settings?
- Device Drivers?

Finding the system hardware (1)

Listing devices from M$ windows

- Before venturing into kernel configuration
  - Get an inventory of the machine's hardware
  - Microsoft's **Device Manager**
- dmesg

Listing devices from dmesg

  - cat /var/run/dmesg.boot

```
psm0: <PS/2 Mouse> irq 12 on atkbdc0
psm0: [GIANT-LOCKED]
psm0: [ITHREAD] psm0: model Generic PS/2 mouse, device ID 0
```

Finding the system hardware (2)

- pciconf
  - pciconf -l

```
ath0@pci0:3:0:0: class=0x020000 card=0x058a1014 chip=0x1014168c
vendor = 'Atheros Communications Inc.'
device = 'AR5212 Atheros AR5212 802.11abg wireless'
class = network subclass = ethernet
```

May not support by GENERIC…

Finding the system hardware (3)

- pciconf & man page
  - man -k *Atheros*
    - Find drivers from company name
  - pciconf -l & man
    - List all attached devices

```
ehci1@pci0:0:29:7:      class=0x0c0320 card=0x3a3a8086 chip=0x3a3a8086 rev=0x00 hdr=0x00
pcib10@pci0:0:30:0:     class=0x060401 card=0x244e8086 chip=0x244e8086 rev=0x90 hdr=0x01
isab0@pci0:0:31:0:      class=0x060100 card=0x3a168086 chip=0x3a168086 rev=0x00 hdr=0x00
ahci0@pci0:0:31:2:      class=0x010601 card=0x3a228086 chip=0x3a228086 rev=0x00 hdr=0x00
none8@pci0:0:31:3:      class=0x0c0500 card=0x3a308086 chip=0x3a308086 rev=0x00 hdr=0x00
em0@pci0:3:0:0: class=0x020000 card=0x00008086 chip=0x10d38086 rev=0x00 hdr=0x00
em1@pci0:2:0:0: class=0x020000 card=0x00008086 chip=0x10d38086 rev=0x00 hdr=0x00
```

  - man *[device]*
    - man em

```
EM(4)                   FreeBSD Kernel Interfaces Manual                   EM(4)

NAME
     em – Intel(R) PRO/1000 Gigabit Ethernet adapter driver
```

Finding the system hardware (4)

- Man page for devices
  - man *[device]*

```
NAME
     em – Intel(R) PRO/1000 Gigabit Ethernet adapter driver

SYNOPSIS
     To compile this driver into the kernel, place the following line in you
     kernel configuration file:

           device em

     Alternatively, to load the driver as a module at boot time, place the
     following line in loader.conf(5):

           if_em_load="YES"
```

Building a FreeBSD Kernel – Configuration file

The explanations on options and devices…

- Each line is a control phrase
  - Keyword + arguments

Keyword	Function	Example
machine	Sets the machine type	i386 or amd64
cpu	Sets the CPU type	I586_CPU or HAMMER
ident	Sets the name of the kernel	SABSD
maxusers	Sets the kernel's table sizes	0
options	Sets various comiple-time options	INET or INET6
device	Declares devices	fxp or em

```
cpu         I486_CPU
cpu         I586_CPU
cpu         I686_CPU
ident       GENERIC
options      SCHED_ULE          # ULE scheduler
options      PREEMPTION         # Enable kernel thread preemption
options      INET               # InterNETworking
device       em
```

i386/conf/GENERIC

https://www.freebsd.org/doc/en/books/handbook/kernelconfig-config.html

Kernel backup

Your last chance to prevent module missing…to survive!!

- Kernel file locations

Old kernel is automatically moved to kernel.old when you're making the new kernel

  - Put in the /boot directory
  - /boot/GENERIC/kernel, /boot/kernel.old/kernel
  - /kernel.GENERIC, /kernel.old (Freebsd 4.x)

Or just simply cp your GENERIC /boot/kernel first!

- If something goes wrong
  - ok mode !
    - unload kernel; load kernel.old/kernel
    - load kernel modules
  - mv /boot/kernel */boot/kernel.bad*

Ok mode

```
Type '?' for a list of commands, 'help' for more detailed help.
OK unload kernel
OK load /boot/kernel.old/kernel
/boot/kernel.old/kernel text=0x34a274 data=0x40df4+0x72d84 syms=[0x4+0x483e0+0x4
+0x64b7e]
OK _
```

Or “enable modules” in the ok mode..

Tuning the FreeBSD Kernel

- sysctl command
  - Dynamically set or get kernel parameters
  - All changes made by sysctl will be lost across reboot
  - Use sysctl to tune the kernel and test it, then recompile the kernel

    The other way is to write your settings into /etc/sysctl.conf…
  - Format:

    % sysctl [options] name[=value] …

  Ex:

  % sysctl -a list all kernel variables

  % sysctl -d kern.maxfiles print the description of the variable

  % sysctl kern.maxfiles print the value of the variable

  % sudo sysctl kern.maxfiles=2048

Kernel modules

- Kernel module location
  - /boot/kernel/*.ko
  - /modules (FreeBSD 4.x)
-
```
zfs[/boot/kernel] -chiahung- kldstat
Id Refs Address    Size     Name
 1   15 0xc0400000 4abd60   kernel
 2    1 0xc08ac000 13b0fc   zfs.ko
 3    2 0xc09e8000 3d5c     opensolaris.ko
 4    2 0xc09ec000 16b84    krpc.ko
 5    1 0xc0a03000 8c48     if_le.ko
```
- Load/unload kernel modules
  - kldload(8), kldunload(8)
    - E.g., kldload if_fxp

Procedure of Loading a Device Module

- Loading a device module
  1. pciconf -l for a device
  2. man vendor name for module name in BSD
  3. grep the name in /boot/kernel/*.ko
  4. kldload [module name]
  5. Setup permanently by
     a) **Recompile the kernel** or
     b) **Add [module name]_enable="YES" in /boot/loader.conf**
