└_§8.1 Relations and Their Properties

Binary Relations

Definition

Let A and B be any two sets. A binary relation R from A to B, written $R : A \leftrightarrow B$, is a subset of $A \times B$. The notation aRb means $(a, b) \in R$.

If aRb, we may say "a is related to b (by relation R)", or "a relates to b (under relation R)".

Example

$$<: \mathsf{N} \leftrightarrow \mathsf{N} :\equiv \{(\mathsf{n}, \mathsf{m}) \mid \mathsf{n} < \mathsf{m}\}. \ \mathsf{a} < \mathsf{b} \text{ means } (\mathsf{a}, \mathsf{b}) \in <.$$

• A binary relation R corresponds to a predicate function $P_R: A \times B \rightarrow \{T, F\}$ defined over the 2 sets A and B.

└_§8.1 Relations and Their Properties

Examples of Binary Relations

• Let $A = \{0, 1, 2\}$ and $B = \{a, b\}$. Then $R = \{(0, a), (0, b), (1, a), (2, b)\}$ is a relation from A to B. For instance, we have 0Ra, 0Rb, etc..

Can we have visualized expressions of relations?

- Let A be the set of all cities, and let B be the set of the 50 states in the USA. Define the relation R by specifying that (a, b) belongs to R if city a is in state b. For instance, (Boulder, Colorado), (Bangor, Maine), (Ann Arbor, Michigan), (Middletown, New Jersey), (Middletown, New York), (Cupertino, California), and (Red Bank, New Jersey) are in R.
- "eats" := $\{(a, b) \mid \text{organism } a \text{ eats food } b\}$.

Chapter 8 Relations

└_§8.1 Relations and Their Properties

Complementary Relations

Definition

Let $R : A \leftrightarrow B$ be any binary relation. Then, $\overline{R} : A \leftrightarrow B$, the *complement* of R, is the binary relation defined by

$$\overline{R} :\equiv \{ (a, b) \mid (a, b) \notin R \} = (A \times B) - R.$$

Note this is just R if the universe of discourse is U = A × B; thus the name complement.

• The complement of \overline{R} is R.

Chapter 8 Relations

└_§8.1 Relations and Their Properties

Inverse Relations

Definition

Any binary relation $R : A \leftrightarrow B$ has an *inverse relation* $R^{-1} : B \leftrightarrow A$, defined by

$$R^{-1} :\equiv \{(b, a) \mid (a, b) \in R\}.$$

Examples

2 If $R : People \rightarrow Foods$ is defined by " $aRb \Leftrightarrow a$ eats b", then

 $bR^{-1}a \Leftrightarrow b$ is eaten by a.

$$R = \left\{ \begin{array}{c} (1,1), (1,2), (1,3), (1,4), (1,5), (2,2), (2,4), \\ (3,3), (4,4), (5,5) \end{array} \right\}$$
$$\overline{R} = \left\{ \begin{array}{c} (2,1), (2,3), (2,5), (3,1), (3,2), (3,4), (3,5), \\ (4,1), (4,2), (4,3), (4,5), (5,1), (5,2), (5,3), \\ (5,4) \end{array} \right\}$$
$$R^{-1} = \left\{ \begin{array}{c} (1,1), (2,1), (3,1), (4,1), (5,1), (2,2), (4,2), \\ (3,3), (4,4), (5,5) \end{array} \right\}$$

└_§8.1 Relations and Their Properties

Combining Relations

Since relations from A to B are subsets of A × B, two relations from A to B can be combined through set operations.

• Let
$$A = \{1, 2, 3\}$$
 and $B = \{1, 2, 3, 4\}$. The relations $R_1 = \{(1, 1), (2, 2), (3, 3)\}$ and $R_2 = \{(1, 1), (1, 2), (1, 3), (1, 4)\}$ can be combined to obtain

$$\begin{aligned} R_1 \cup R_2 &= \{(1,1), (1,2), (1,3), (1,4), (2,2), (3,3)\}, \\ R_1 \cap R_2 &= \{(1,1)\}, \\ R_1 - R_2 &= \{(2,2), (3,3)\} \\ R_2 - R_1 &= \{((1,2), (1,3), (1,4)\}. \end{aligned}$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

• Quiz: What is $R_1 \oplus R_2$?

Chapter 8 Relations

└_§8.1 Relations and Their Properties

Composite Relations

• Let $R : A \leftrightarrow B$, and $S : B \leftrightarrow C$. Then the composite $S \circ R$ of R and S is defined as: $S \circ R = \{(a, c) \mid aRb \land bSc\}$.

Example 1 Function composition $f \circ g$ is an example. Example 2 $A = \{1, 2, 3\}, B = \{a, b, c, d\}, C = \{x, y, z\}.$

■
$$R : A \leftrightarrow B, R = \{(1, a), (1, b), (2, b), (2, c)\}.$$

■ $S : B \leftrightarrow C, S = \{(a, x), (a, y), (b, y), (d, z)\}.$
■ $S \circ R = \{(1, x), (1, y), (2, y)\}.$

Chapter 8 Relations

└_§8.1 Relations and Their Properties

Relations on a Set

Definition

A (binary) relation from a set A to itself is called a relation on the set A.

- E.g., the "<" relation from earlier was defined as a relation on the set N of natural numbers.
- The *identity relation* I_A on a set A is the set $\{(a, a) \mid a \in A\}$.
- Let A be the set {1, 2, 3, 4}. Which ordered pairs are in the relation R = {(a, b) | a divides b}?
- How many relations are there on a set with *n* elements?

Chapter 8 Relations

└_§8.1 Relations and Their Properties

Reflexivity

Definition

A relation R on A is *reflexive* if $\forall a \in A, aRa$. A relation is *irreflexive* iff its complementary relation is reflexive.

- E.g., the relation $\geq :\equiv \{(a, b) \mid a \geq b\}$ is reflexive.
- E.g., < is irreflexive.
- "irreflexive" ≠ "not reflexive"!
- "likes" between people is not reflexive, but not irreflexive either. (Not everyone likes themselves, but not everyone dislikes themselves either.)

└_§8.1 Relations and Their Properties

Example 7 from Textbook

Example

Consider the following relations on $\{1, 2, 3, 4\}$.

Which of these relations are reflexive, irreflexive, and not reflexive?

└_§8.1 Relations and Their Properties

Symmetry & Antisymmetry

Definition

- A binary relation R on A is symmetric iff $(a, b) \in R \leftrightarrow (b, a) \in R$, i.e. $R = R^{-1}$.
 - E.g., = (equality) is symmetric, and < is not.
 - "is married to" is symmetric, and "likes" is not.
- A binary relation R is antisymmetric if

 (a, b) ∈ R ∧ (b, a) ∈ R → a = b.

■ E.g., < is antisymmetric, and "likes" is not.

- Which relations from Example 7 are symmetric and which are antisymmetric?
- If R_1 is symmetric and R_2 is antisymmetric, is it true that $R_1 \cap R_2 = \emptyset$?

Chapter 8 Relations

└_§8.1 Relations and Their Properties

Transitivity

Definition

A relation R is transitive iff

$$\forall a, b, c : (a, b) \in R \land (b, c) \in R \rightarrow (a, c) \in R.$$

A relation is *intransitive* if it is not transitive.

- E.g., "is an ancestor of" is transitive, and "likes" is intransitive.
- Which of the relations in Example 7 are transitive?
- Is the "divides" relations on the set of positive integers transitive?
- "is within 1 mile of" is ... ?

Chapter 8 Relations

└_§8.1 Relations and Their Properties

The Power of A Relation

Definition

The *n*th power R^n of a relation R on a set A can be defined recursively by

$$\left\{ egin{array}{ll} R^0:\equiv I_A; \ R^{n+1}:\equiv R^n\circ R ext{ for all } n\geq 0. \end{array}
ight.$$

The negative powers of R can also be defined if desired, by $R^{-n} :\equiv (R^{-1})^n$.

└_§8.1 Relations and Their Properties

Whether A Relation Is Transitive Or Not?

Theorem

The relation R on a set A is transitive if and only if $\mathbb{R}^n \subseteq \mathbb{R}$ for all $n = 1, 2, 3, \cdots$.

- Think about what $(a, b) \in \mathbb{R}^k$ means?
- How to prove an "if and only if" statement?
- Let $R = \{(1, 1), (2, 1), (3, 2), (4, 3)\}$. Find the powers R^n for $n = 2, 3, \cdots$.
- Let $R = \{(1, 2), (1, 3), (2, 2), (2, 3), (4, 3)\}$. Find the powers R^n for $n = 2, 3, \cdots$.

Chapter 8 Relations

└-§8.2 *n*-ary Relations and Their Applications

n-ary Relations

Definition

An *n*-ary relation *R* on sets A_1, \dots, A_n , written $R : A_1, \dots, A_n$, is a subset $R \subseteq A_1 \times \dots \times A_n$.

- The sets A_i are called the *domains* of R.
- The *degree* of *R* is *n*.
- R is functional in domain A_i if it contains at most one n-tuple
 (···, a_i, ···) for any value a_i within domain A_i.

└§8.2 *n*-ary Relations and Their Applications

Relational Databases

- A *relational database* is essentially an *n*-ary relation *R*.
- A domain A_i is a *primary key* for the database if the relation R is functional in A_i.

A composite key for the database is a set of domains {A_i, A_j, ...} such that R contains at most 1 n-tuple (..., a_i, ..., a_j, ...) for each composite value (a_i, a_j, ...) ∈ A_i × A_j ×

└_§8.2 *n*-ary Relations and Their Applications

Selection Operators

- Let A be any n-ary domain A = A₁ × · · · × A_n, and let C : A → {T, F} be any condition (predicate) on elements (n-tuples) of A.
- Then, the selection operator s_C is the operator that maps any (n-ary) relation R on A to the n-ary relation of all n-tuples from R that satisfy C.

• I.e., $\forall R \subseteq A$,

$$s_C(R) = R \cap \{a \in A \mid s_C(a) = T\}$$

= $\{a \in R \mid s_C(a) = T\}.$

§8.2 *n*-ary Relations and Their Applications

Selection Operator Example

- Suppose we have a domain
 A = StudentName × Standing × SocSecNos.
- Suppose we define a certain condition on A,

UpperLevel(*name*, *standing*, *ssn*)

- : $\equiv [(standing = junior) \lor (standing = senior)]$
- Then, s_{UpperLevel} is the selection operator that takes any relation R on A (database of students) and produces a relation consisting of just the upper-level classes (juniors and seniors).

└_§8.2 *n*-ary Relations and Their Applications

Projection Operators

• Let $A = A_1 \times \cdots \times A_n$ be any *n*-ary domain, and let $\{i_k\} = (i_1, \dots, i_m)$ be a sequence of indices all falling in the range 1 to *n*.

• That is, where $1 \leq i_k \leq n$ for all $1 \leq k \leq m$.

Then the projection operator on n-tuples

$$P_{\{i_k\}}: A \to A_{i_1} \times \cdots \times A_{i_m}$$

is defined by

$$P_{\{i_k\}}\left(a_1,\cdots,a_n
ight)=\left(a_{i_1},\cdots,a_{i_m}
ight).$$

§8.2 *n*-ary Relations and Their Applications

Projection Example

- Suppose we have a ternary (3-ary) domain Cars = Model × Year × Color. (n = 3)
- Consider the index sequence $\{i_k\} = \{1, 3\}$. (m = 2)
- Then the projection P_{{i_k} simply maps each tuple (a₁, a₂, a₃) = (model, year, color) to its image:

$$(a_{i_1}, a_{i_2}) = (a_1, a_3) = (model, color).$$

■ This operator can be usefully applied to a whole relation R ⊆ Cars (database of cars) to obtain a list of model/color combinations available.

Chapter 8 Relations

└_§8.2 *n*-ary Relations and Their Applications

Join Operator

- Puts two relations together to form a sort of combined relation.
- If the tuple (*A*, *B*) appears in *R*₁, and the tuple (*B*, *C*) appears in *R*₂, then the tuple (*A*, *B*, *C*) appears in the join *J*(*R*₁, *R*₂).
- A, B, C can also be sequences of elements rather than single elements.

Chapter 8 Relations

└_§8.2 *n*-ary Relations and Their Applications

Join Example

Suppose R₁ is a teaching assignment table, relating *Professors* to *Courses*.

- Suppose R₂ is a room assignment table relating *Courses* to *Rooms* and *Times*.
- Then J(R₁, R₂) is like your class schedule, listing (professor, course, room, time).

Chapter 8 Relations

└_§8.3 Representing Relations

Representing Relations

Some ways to represent n-ary relations:

- With an explicit list or table of its tuples.
- With a function from the domain to $\{T, F\}$.

Some special ways to represent binary relations:

- With a zero-one matrix.
- With a directed graph.

└_§8.3 Representing Relations

Using Zero-One Matrices

- To represent a relation R by a matrix $\mathbf{M}_R = [m_{ij}]$, let $m_{ij} = 1$ if $(a_i, b_j) \in R$, else 0.
- E.g., Joe likes Susan and Mary, Fred likes Mary, and Mark likes Sally. The 0 – 1 matrix representation of that "Likes" relation:

	Susan	Mary	Sally	
Joe	[1	1	0]	
Fred	0	1	0	
Mark	0	0	1	

└_§8.3 Representing Relations

Examples

Example

Let $S = \{\text{Spring}, \text{Summer}, \text{Fall}, \text{Winter}\}$ and $F = \{\text{Apple}, \text{Berry}, \text{Cherry}, \text{Durian}\}$. Which ordered pairs are in the relation R represented by the matrix?

	Apple	Berry	Cherry	Durian
Spring	1	0	1	0
Summer	0	0	1	1
Fall	0	1	0	0
Winter	1	0	0	0

Zero-One Reflexive, Symmetric

- Terms: reflexive, non-reflexive¹, irreflexive, symmetric, asymmetric², and antisymmetric.
 - These relation characteristics are very easy to recognize by inspection of the zero-one matrix.

¹A relation R on A is non-reflexive if it is not reflexive.

Chapter 8 Relations

└_§8.3 Representing Relations

Matrix Operation v.s. Relation Operations

$$\blacksquare \mathsf{M}_{R_1 \cup R_2} = \mathsf{M}_{R_1} \lor \mathsf{M}_{R_2}; \mathsf{M}_{R_1 \cap R_2} = \mathsf{M}_{R_1} \land \mathsf{M}_{R_2}.$$

• \vee and \wedge are element-wise Boolean operators.

$$\blacksquare \mathbf{M}_{S \circ R} = \mathbf{M}_R \odot \mathbf{M}_S; \, \mathbf{M}_{R^n} = (\mathbf{M}_R)^n.$$

• \odot denotes Boolean matrix multiplications.

$$\bullet \mathbf{M}_{R^{-1}} = (\mathbf{M}_R)^T.$$

Quiz: If R is a symmetric relation, M_R is a symmetric matrix.

Chapter 8 Relations

Using Directed Graphs

• A directed graph or digraph $G = (V_G, E_G)$ is a set V_G of vertices (nodes) with a set $E_G \subseteq V_G \times V_G$ of edges (*arcs*, *links*). Visually represented using dots for nodes, and arrows for edges. Notice that a relation $R : A \leftrightarrow B$ can be represented as a graph $G_R = (V_G = A \cup B, E_G = R)$.

└_§8.3 Representing Relations

Digraph Reflexive, Symmetric

 It is extremely easy to recognize the reflexive/irreflexive/symmetric/antisymmetric properties by graph inspection.

Reflexive:Irreflexive:Every nodeNo nodehas a self-looplinks to itself

Asymmetric, non-antisymmetric

Symmetric: Every link is bidirectional

Antisymmetric: No link is bidirectional

Non-reflexive, non-irreflexive

Closures of Relations

- For any property X, the "X closure" of a set (or relation) R is defined as the "smallest" superset of R that has the given property.
- The *reflexive closure* of a relation R on A is obtained by adding (a, a) to R for each $a \in A$. I.e., it is $R \cup I_A$.
- The symmetric closure of R is obtained by adding (b, a) to R for each (a, b) in R. I.e., it is R ∪ R⁻¹.
- The transitive closure or connectivity relation of R is obtained by repeatedly adding (a, c) to R for each (a, b) and (b, c) in R. I.e., it is

$$R^* = \bigcup_{n \in Z^+} R^n.$$

└_§8.4 Closures of Relations

Paths in Digraphs/Binary Relations

Definition

A path of length n from node a to b in the directed graph G (or the binary relation R) is a sequence $(a, x_1), (x_1, x_2), \dots, (x_{n-1}, b)$ of n ordered pairs in E_G (or R). A path of length $n \ge 1$ from a to a is called a *circuit* or a *cycle*.

Theorem

There exists a path of length n from a to b in R if and only if $(a, b) \in R^n$.

- An empty sequence of edges is considered a path of length 0 from a to a.
- If any path from a to b exists, then we say that a is connected to b. ("You can get there from here.")

└_§8.4 Closures of Relations

Simple Transitive Closure Algorithm

Lemma

Let A be a set with n element, and let R be a relation on A. If there is a path of length at least one in R from a to b, then there is such a path with length not exceeding n.

procedure transClosure(M_R : rank-*n* 0-1 matrix) // A procedure computes R^* with 0-1 matrices. $A := B := M_R$; for i := 2 to *n* begin $A := A \odot M_R$; $B := B \lor A$; end return B

• This algorithm takes $\Theta(n^4)$ time.

└_§8.4 Closures of Relations

A Faster Transitive Closure Algorithm

procedure transClosure(M_R : rank-*n* 0-1 matrix) $A := B := M_R$; for i := 2 to $\lceil \log_2 n \rceil$ begin $A := A \odot A$; // A represents R^{2^i} . $B := B \lor A$; // "add" into B. end

return B

 This algorithm takes only Θ(n³logn) time, BUT NOT CORRECT.

Roy-Warshall Algorithm

```
procedure Warshall(M_R: rank-n 0-1 matrix)

W := M_R;

for k := 1 to n

for i := 1 to n

for j := 1 to n

w_{ij} := w_{ij} \lor (w_{ik} \land w_{kj})

return W {This represents R^*.}
```

- Uses only $\Theta(n^3)$ operations!
- w_{ij} = 1 means there is a path from i to j going only through nodes ≤ k.

Chapter 8 Relations

└_§8.4 Closures of Relations

Example

Find the symmetric closure, reflexive closure, and transitive closure of the following relation.

└_§8.5 Equivalence Relations

Equivalence Relations

Definition

An equivalence relation (e.r.) on a set A is simply any binary relation on A that is reflexive, symmetric, and transitive.

- E.g., "=" itself is an equivalence relation.
- For any function $f : A \to B$, the relation "have the same f value", or $=_f :\equiv \{(a_1, a_2) \mid f(a_1) = f(a_2)\}$ is an equivalence relation.
 - E.g., let m = "mother of", then =_m:≡ "have the same mother" is an e.r..

└_§8.5 Equivalence Relations

Equivalence Classes

Definition

Let R be any equivalence relation on a set A. The *equivalence* class of a is

$$[a]_R := \{b \mid aRb\}$$
. (optional subscript R)

- It is the set of all elements of A that are "equivalent" to a according to the E.R. R.
- Each such b (including a itself) is called a representative of [a]_R.

└_§8.5 Equivalence Relations

Equivalence Class Examples

- "Strings a and b are the same length."
 - [a] = the set of all strings of the same length as a.
- "Integers a and b have the same absolute value."
- "Real numbers *a* and *b* have the same fractional part (i.e., $a b \in Z$)."
- "Integers a and b have the same residue modulo m." (for a given m > 1)

└_§8.5 Equivalence Relations

Equivalence Class Examples

- "Strings a and b are the same length."
 - [a] = the set of all strings of the same length as a.
- "Integers a and b have the same absolute value."

 $\bullet [a] = \text{the set } \{a, -a\}.$

- "Real numbers *a* and *b* have the same fractional part (i.e., $a b \in Z$)."
- "Integers a and b have the same residue modulo m." (for a given m > 1)

└_§8.5 Equivalence Relations

Chapter 8 Relations

└_§8.5 Equivalence Relations

Partitions

Definition

A *partition* of a set A is the set of all the equivalence classes $\{A_1, A_2, \dots\}$ for some e.r. on A.

Example

Let $m \in \mathbb{Z}^+$. For any $a, b \in \mathbb{Z}$, we define aRb iff $m \mid a - b$. Then, R is an e.r., and $\{[0], [1], \dots, [m-1]\}$ is a partition of \mathbb{Z} for R.

- The A_i's are all disjoint and their union is equal to A.
- They "partition" the set into pieces. Within each piece, all members of the set are equivalent to each other.

└_§8.6 Partial Orderings

Partial Orderings

Definition

A relation R on a set S is called a partial ordering or partial order if it is reflexive, antisymmetric, and transitive. A set S together with a partial ordering R is called a *partially ordered set*, or *poset*, and is denoted by (S, R).

- The "greater than or equal" relation ≥ is a partial ordering on the set of integers.
- The divisibility relation | is a partial ordering on the set of positive integers.
- The inclusion relation \subseteq is a partial ordering on the power set of a set S.

└_§8.6 Partial Orderings

Definition

If (S, \preccurlyeq) is a poset and every two elements of S are comparable, S is called a *totally ordered set* or *linearly ordered set*, and \preccurlyeq is called a total order or a linear order. A totally ordered set is also called a chain.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

• E.g., (\mathbb{N}, \leq) .

└_§8.6 Partial Orderings

Lexicographic Order

- (A_1, \preccurlyeq_1) and (A_1, \preccurlyeq_2) are posets. For any $(a_1, a_2), (b_1, b_2) \in A_1 \times A_2$, we say $(a_1, a_2) \preccurlyeq (b_1, b_2)$ if and only if $a_1 \preccurlyeq_1 b_1$ or both $a_1 = b_1$ and $a_2 \preccurlyeq_2 b_2$.
- The lexicographic order of the Cartesian product of posets is a partial order.

Please prove this by yourself.

└§8.6 Partial Orderings

Digraphs for finite posets can be simplified by following ideas.

- 1 Remove loops at every vertices.
- 2 Remove edge that must be present because of the transitivity.

- 3 Arrange each edge so that its initial vertex is below its terminal vertex.
- 4 Remove all the arrows.
- The simplified diagrams are called *Hasse diagrams*.

└_§8.6 Partial Orderings

Example of Hasse Diagrams

└_§8.6 Partial Orderings

Example of Hasse Diagrams (Cont.)

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 三臣 - のへ⊙

└_§8.6 Partial Orderings

Maximal and Minimal Elements

Definition

a is a *maximal* (resp., *minimal*) element in the poset (S, \preccurlyeq) if there is no $b \in S$ such that $a \prec b$ (resp., $b \prec a$).

Definition

a is the *greatest* (resp., *least*) element of the poset (S, \preccurlyeq) if $b \preccurlyeq a$ (resp., $a \preccurlyeq b$) for all $b \in S$.

Lemma

Every finite nonempty poset (S, \preccurlyeq) has a minimal element.

└§8.6 Partial Orderings

Maximal and Minimal Elements (Cont.)

Definition

A is a subset of of a poset (S, \preccurlyeq) .

- $u \in S$ is called an upper bound (resp., lower bound) of A if $a \preccurlyeq u$ (resp., $u \preccurlyeq a$) for all $a \in A$.
- x ∈ S is called the least upper bound (resp., greatest lower bound) of A if x is an upper bound (resp., lower bound) that is less than every other upper bound (resp., lower bound) of A.

Definition

 (S, \preccurlyeq) is a *well-ordered set* if it is a poset such that \preccurlyeq is a total ordering and every nonempty subset of S has a least element.

- E.g., (\mathbb{Z}^+, \leq) is *well-ordered* but (\mathbb{R}, \leq) is not.
- There is "well-ordered induction".

└_§8.6 Partial Orderings

Lattices

Definition

A partially ordered set in which every pair of elements has both a least upper bound and a greatest lower bound is called a lattice.

Example

Determine whether the posets $(\{1, 2, 3, 4, 5\}, |)$ and $(\{1, 2, 4, 8, 16\}, |)$ are lattices.

- na (~

└_§8.6 Partial Orderings

Topological Sorting

- Motivation: A project is make up of 20 different tasks. Some tasks can be completed only after others have been finished. How can an order be found for these tasks?
- Topological sorting: Given a partial ordering R, find a total ordering ≼ such that a ≼ b whenever aRb. ≼ is said compatible with R.

Chapter 8 Relations
